

## CHAPTER – 2 “Is Matter Around Us Pure”

### CONCEPT DETAILS

KEY CONCEPTS : [ \*rating as per the significance of concept ]

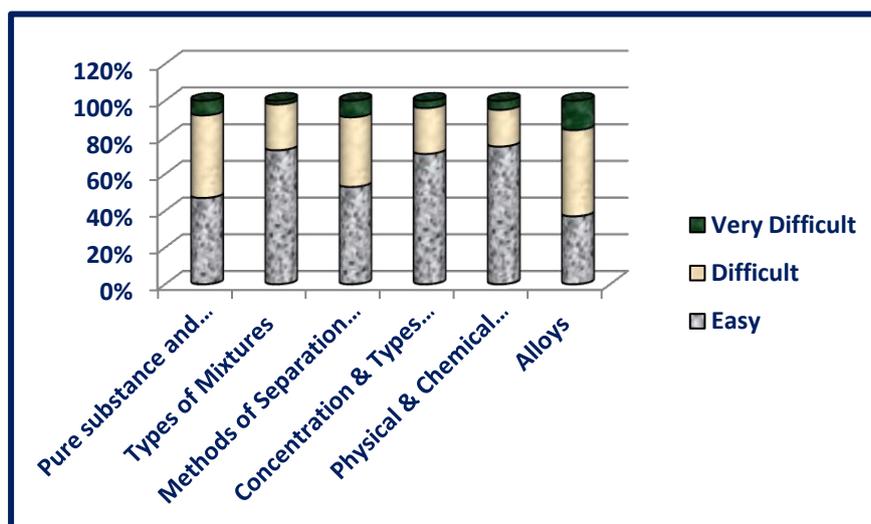

1. Pure Substance & Mixture	***
2. Types of Mixtures	****
3. Methods of Separation of Mixtures	*****
4. Concentration & Types of Solutions	*****
5. Physical & Chemical Changes	***
6. Alloys	**

#### Pre requisites

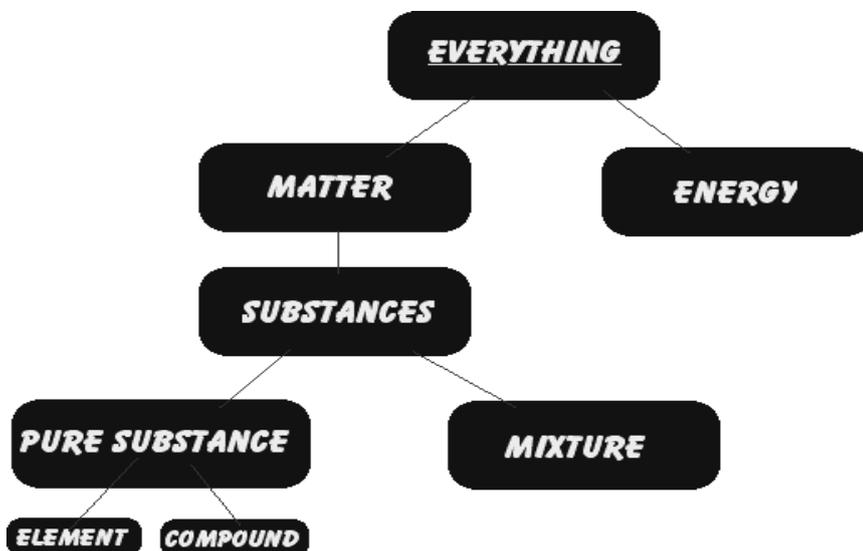

- Basic knowledge of particle nature of matter
- Different states of matter

### SURVEY ANALYSIS

Conceptual levels of comprehension on the basis of feedback taken from the students

## 1. Pure Substance & mixture

PURE SUBSTANCE	MIXTURE
<ul style="list-style-type: none"> <li>• Pure substance consists of a single type of substance .</li> </ul>	<ul style="list-style-type: none"> <li>• Mixture consists of two or more pure substances.</li> </ul>
<ul style="list-style-type: none"> <li>• Pure substance cannot be separated into other substances by physical methods.</li> </ul>	<ul style="list-style-type: none"> <li>• Mixture can be separated into its components by physical methods.</li> </ul>
<ul style="list-style-type: none"> <li>• Pure substance has its own definite properties.</li> </ul>	<ul style="list-style-type: none"> <li>• Mixture shows the properties of its components.</li> </ul>

Elements are made up of one kind of atoms only. Compounds are made up of one kind of molecules only.

### **Difference between Compound & Mixture**

[ refer NCERT text Book Tab.2.2, page 26]

Q.1 Is air around us a compound or mixture?

Q.2 Water is a compound. Justify.

Q.3 Classify the following as element , compound and mixture: Iron , sea water , Milk

Q.4 Are the naturally occurring material in nature chemically pure substances?

## 2. Types of Mixtures

Mixtures can also be grouped

*i) on the basis of their physical states:*

	SOLID	LIQUID	GAS
SOLID	<ul style="list-style-type: none"><li>• Salt and sugar</li></ul>	<ul style="list-style-type: none"><li>• Salt and water</li></ul>	<ul style="list-style-type: none"><li>• Dust in air</li></ul>
LIQUID	<ul style="list-style-type: none"><li>• Mercury and copper</li></ul>	<ul style="list-style-type: none"><li>• Alcohol and water</li></ul>	<ul style="list-style-type: none"><li>• Clouds</li></ul>
GAS	<ul style="list-style-type: none"><li>• Hydrogen and palladium</li></ul>	<ul style="list-style-type: none"><li>• Oxygen and water</li></ul>	<ul style="list-style-type: none"><li>• Air</li></ul>

*ii) on the basis of miscibility:*

Homogeneous Mixture	Heterogeneous Mixture
<ul style="list-style-type: none"><li>• It consists of single phase.</li><li>• Uniform composition.</li><li>• Example: Sugar dissolved in water</li></ul>	<ul style="list-style-type: none"><li>• It consists of two or more phase.</li><li>• Does not have uniform composition.</li><li>• Example: Air, sand and common salt.</li></ul>

- Q.1 Give one example for each of the following mixtures: i) Solid/solid (homogeneous) ii) Solid/solid (heterogeneous) iii) Liquid/liquid (homogeneous) iv) Liquid/liquid (heterogeneous) v) Gas/liquid (homogeneous)..
- Q.2 Classify the following as homogeneous & heterogeneous mixture:  
i) sodium chloride & water ii) glucose & water iii) sand & water iv) air

## 4. Separating the components of a mixture

The components of a heterogeneous mixture can be separated by

- **simple methods like -**
  - hand picking , sieving , & Winnowing
- **special techniques like -**
  - Evaporation** : a mixture of salt and water or sugar and water.
  - Centrifugation** : Butter from curd, Fine mud particles suspended in water.
  - Decantation (Using separating funnel)** : Oil from water.
  - Sublimation** : Camphor from salt,
  - Chromatography** : Different pigments from an extract of flower petals.
  - Distillation and fractional distillation** : Separating components of Petroleum
  - Magnetic separation:** Iron pins from sand.

Q.1 Name the process you would use to :  
 i) recover sugar from an aqueous sugar solution.  
 ii) separate mixture of salt solution and sand.  
 Q.2 How will you separate a mixture of sand , water and mustard oil ?

## 5. Concentration of Solution

The amount of solute present in a given amount (mass or volume) of solution.

$$\text{Concentration of a solution} = \frac{\text{Amount of solute}}{\text{Amount of solvent}} \quad \text{OR} \quad \frac{\text{Amount of solute}}{\text{Amount of solution}}$$

The concentration of a solution can be expressed as mass by mass percentage or as mass by volume percentage.

$$\text{Mass by mass percentage of a solution} = \frac{\text{Mass of solute}}{\text{Mass of solution}} \times 100$$

$$\text{Mass by volume percentage of a solution} = \frac{\text{Mass of solute}}{\text{Volume of solution}} \times 100$$

## Types of Solutions

a) on the basis of size of solute particles:

True solution	Sol [ Colloid]	Suspension
<ul style="list-style-type: none"> <li>Homogeneous</li> </ul>	<ul style="list-style-type: none"> <li>Heterogeneous</li> </ul>	<ul style="list-style-type: none"> <li>Heterogeneous</li> </ul>
<ul style="list-style-type: none"> <li>Size of solute particles is less than 1 nm or <math>10^{-9}</math> m .</li> </ul>	<ul style="list-style-type: none"> <li>Size of solute particles is between 1 nm to 1000 nm.</li> </ul>	<ul style="list-style-type: none"> <li>Size of solute particles is more than 1000 nm.</li> </ul>
<ul style="list-style-type: none"> <li>Particles cannot pass through filter paper.</li> </ul>	<ul style="list-style-type: none"> <li>Particles can pass through filter paper.</li> </ul>	<ul style="list-style-type: none"> <li>Particles cannot pass thorough filter paper.</li> </ul>
<ul style="list-style-type: none"> <li>Stable</li> </ul>	<ul style="list-style-type: none"> <li>Stable and settle only on centrifugation.</li> </ul>	<ul style="list-style-type: none"> <li>Unstable and settle down on its own.</li> </ul>
<ul style="list-style-type: none"> <li>Solution of sodium chloride in water, sugar &amp; water.</li> </ul>	<ul style="list-style-type: none"> <li>Milk , Fog</li> </ul>	<ul style="list-style-type: none"> <li>muddy water, chalk &amp; water,</li> <li>smoke in the air.</li> </ul>

[ types of colloids : refer NCERT Text Book table 2.1 , page 18 ]

Colloidal solution is a heterogeneous mixture. It consists of two phases:-

(i) **Dispersed phase** : component present in small proportion

(ii) **Dispersion medium** : component present in large proportion

The particles of colloid are large enough to scatter a beam of light passing through it and make its path visible. Thus, they show **Tyndall effect**.

The colloidal particles are moving at random in a zigzag motion in all directions.

This type of zig-zag motion of colloidal particles is called **Brownian movement**.

**b) on the basis of amount of solute:**

<b>Unsaturated solution</b>	<b>Saturated Solution</b>	<b>Supersaturated solution</b>
A solution which has lesser amount of solute that it can dissolve at a given temperature is known as unsaturated solution.	A solution which has maximum amount of solute that it can dissolve at a given temperature is known as saturated solution.	A solution which can dissolve amount of solute by increasing temperature saturated solution is known as supersaturated solution.

**c) on the basis of nature of solvent**

<b>Aqueous solution</b>	<b>Non-Aqueous solution</b>
The solution in which the solvent is water is known as aqueous solution.	The solution in which the solvent is other than water (ether, alcohol or acetone) known as non-aqueous solution.

*Q.1 Classify the following substances into true solutions and colloidal solutions.*

*Milk , ink , starch dissolved in water.*

*Q.2 A solution has been prepared by dissolving 5g of urea in 95 g of water. What is the mass percent of urea in the solution?*

*Q.3 Give an example of an aqueous solution in which gas is dissolved.*

## **6.Physical & Chemical Changes**

**Physical changes** - Changes that do not result in the production of a new substance.

- If you melt a block of ice, you still have H<sub>2</sub>O at the end of the change.
- If you break a bottle, you still have glass.

**Examples** : melting, freezing, condensing, breaking, crushing, cutting, and bending.

**Chemical changes** - Changes that result in the production of another substance.

- As in the case of autumn leaves, a change in color is a clue to indicate a chemical change.
- a half eaten apple that turns brown.

Q.1 Which of the following is an example of physical change?

- a. Mixing baking soda and vinegar together, and this causes bubbles and foam.
- b. A glass cup falls from the counter and shatters on the ground.
- c. Lighting a piece of paper on fire and the paper burns up and leaves ashes.
- d. Baking a birthday cake for your mother.

Q.2. Which of the following is an example of chemical change?

- a. Filling up a balloon with hot air.
- b. Taking a glass of water and freezing it by placing it in the freezer.
- c. A plant collecting sunlight and turning it into food.
- d. Your dog ripping up your homework.

3. Which change can be easily be reversed?

- a. Chemical Change
- b. Physical Change
- c. Both a physical and chemical change
- d. Neither a physical or chemical change

## 7. Alloys

A material that has metallic properties and is composed of two or more chemical elements of which at least one is a metal .

- These cannot be separated into their components by physical methods.
- However, these are considered as mixture because these show the properties of its constituents and can have variable composition.

***The benefit of alloys is that you can combine metals that have varying characteristics to create an end product that is stronger, more flexible, or otherwise desirable to manufacturers.***

- Aluminium alloys are extensively used in the production of automotive engine parts.
- Copper alloys have excellent electrical and thermal performance, good corrosion resistance, high ductility and relatively low cost.

- Stainless steel alloys are used for many commercial applications such as watch straps, cutlery etc.
- Titanium alloys have high strength, toughness and stiffness & are used in aerospace structures .

*Q.1 Why should we use alloys instead of pure metals?*

*Q.2 State uses of Aluminium & Stainless steel alloys.*

### QUESTION BANK [ \*HOTS ]

#### **1 Mark Questions:**

1. What is meant by pure substance?
2. What is meant by mass percentage of solution?
3. Name the process of separation of miscible liquids.
4. Arrange the following in decreasing order of size of the particles.  
True Solution , Suspension , Colloid.
5. \*Give an example of an aqueous solution in which gas is dissolved.
6. Name the dispersion medium and dispersed phase in the white material inside an egg.
7. What happens when hot saturated solution is cooled?
8. How would you separate a mixture of chalk and water?
9. \*How much water should be added to 15 grams of salt to obtain 15 % salt solution?
10. What type of mixtures are separated by technique of crystallization ?

#### **2 Marks Questions:**

1. Which of the following materials fall in the category of a pure substance?  
a) Ice                      b) Milk                      c) Iron                      d) Hydrochloric acid  
e) Calcium oxide      f) Mercury                  g) Brick                      h) Wood.
2. What do you understand by saturated solution and unsaturated solution?
3. \*What do you observe when sunlight passes through a dense forest?
4. List two points of differences between homogeneous and heterogeneous mixtures.
5. State the difference between aqueous & non aqueous solution .
6. Which of the following will show "Tyndal Effect" & Why ?  
a) Salt Solution    b) Milk                  c) Copper Sulphate Solution    d) Starch Solution

7. \*How can we obtain pure copper sulphate from an impure sample?
8. Give two differences between compounds and mixtures.
9. Why is hydrogen considered as element? Give two reasons.
10. Why water is a compound and not a mixture?

### **3 Marks Questions:**

1. Classify the following into elements, compounds and mixtures:  
a) Sodium   b) Soil   c) Sugar solution   d) Silver   e) Calcium carbonate   f) Tin  
g) Silicon   h) Coal   i) Air   j) Soap   k) Methane   l) Carbon dioxide   m) Blood.
2. Give any two applications of centrifugation.
3. Which of the following is chemical change?  
a) Growth of a plant   b) Rusting of iron   c) Mixing of iron fillings and sand  
d) Cooking of food   e) Digestion of food   f) Freezing of water   g) Burning of a candle.
4. \*State the difference between simple distillation & fractional distillation.
5. \* A solution contains 40 ml of ethanol mixed with 100 ml of water. Calculate the concentration in terms of volume by volume percentage of the solution.

### **5 Marks Questions:**

1. \*What is meant by Tyndall effect? What is its cause? Illustrate with example.
2. How would you separate the mixture containing sulphur and sand?
3. What is crystallization? Give its two applications.
4. How are sol, solution and suspension different from each other?
5. How do we obtain coloured components, i.e. dye from Blue/Black ink?

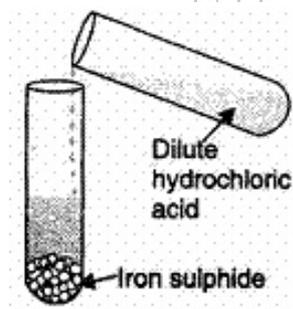

**You are expected to know.....**

- Types of mixtures.
- Method of Separation of mixtures.
- Types of solutions.
- Concentration terms of solution.
- Physical and Chemical Change.
- Significance of alloys.

\*\*\*\*\*

**CBSE Test Paper 01**  
**Chapter 02 Is matter around us pure**

1. Which of the following settles down when allowed to stand undisturbed does sometimes? (1)
  - a. Copper sulphate solution
  - b. Blood
  - c. Muddy water
  - d. Solution of egg albumin in water
  
2. A mixture of iron filings and sulphur is heated, the colour of the mixture will change (1)
  - a. black to yellow
  - b. yellow to black
  - c. brown to yellow
  - d. black to brown
  
3. In the experiment shown a gas is evolved. Four groups of students have recorded their observations on the gas produced as shown in the following table. Choose the correct set of observations. Note that the positive responses are shown by '✓' and negative by '✗' signs respectively. (1)

	Colour of the gas	Odour of the gas	Flammability	Action on lead acetate paper
a.	✗	✓	✗	✓

	Colour of the gas	Odour of the gas	Flammability	Action on lead acetate paper
b.	x	✓	✓	x
c.	x	x	✓	x
d.	✓	✓	x	✓

4. Which of the following solution scatter light? (1)
- None of these
  - Both colloidal solution and suspension
  - colloidal solution
  - suspension
5. A Substance can be beaten into sheets and beaten into wires. What will you call it? (1)
- It is both brittle and lustrous
  - It is both sonorous and ductile
  - It is both Malleable and ductile
  - It is both malleable and brittle
6. Which of the following methods would you use to separate cream from milk? (1)
- centrifugation
  - filtration
  - distillation
  - fractional distillation
7. A shining thick liquid is often used in glass thermometers. Name it. (1)
8. A saturated solution becomes unsaturated on heating. Why is it so? (1)

9. How will you justify that rusting of iron is a chemical change? **(1)**
10. Define crystallisation. **(1)**
11. In what respect does a true solution differ from a colloidal solution? **(3)**
12. Describe a method that can be used to separate a mixture of salt and ammonium chloride. **(3)**
13. 'Sea water can be classified as homogeneous as well as heterogeneous mixture.'  
Comment. **(3)**
14. A compound is regarded as a pure substance while the mixture is not. Give reason. **(3)**
15. Fog and cloud are both colloidal in nature. How do they differ? **(1)**

**CBSE Test Paper 01**  
**Chapter 02 Is matter around us pure**

**Answers**

1. c. Muddy water

**Explanation:** Muddy water will settle down because particles are heavy and settle due to gravity. Settling down of coarse particles under the influence of gravity is called sedimentation. During sedimentation, heavier particles settle down faster than finer particles.

2. b. yellow to black

**Explanation:** A mixture of iron filings and sulphur is heated, the colour of the mixture will change yellow to black.

S is black in colour and FeS is black in colour.

Iron + sulphur → Ferrous sulphide

$\text{Fe} + \text{S} \rightarrow \text{FeS}$

3. a.

Colour of the gas	Odour of the gas	Flammability	Action on lead acetate paper
x	✓	x	✓

**Explanation:** If we add HCl in FeS it will release  $\text{H}_2\text{S}$  Reaction takes place as follows:

$\text{FeS} + 2\text{HCl} \rightarrow \text{FeCl}_2 + \text{H}_2\text{S}$

$\text{H}_2\text{S}$  gas turns lead acetate paper black. It is colourless, has smell of rotten eggs, does not catch fire.

4. b. Both colloidal solution and suspension

**Explanation:** As the particle size of both colloidal & suspension is large they are able to scatter light.

5. c. It is both Malleable and ductile

**Explanation:** The property of metals by which they can be beaten in to thin sheets is called malleability.

The property of metal by which it can be drawn into wires is called ductility.

Gold is most malleable and ductile element.

6. a. centrifugation

**Explanation:** In centrifugation by churning the milk at a high speed, the cream collects at the centre and being lighter than milk floats at the top of the mixture. As cream is lighter than milk.

7. The shining liquid is mercury (metal). It is used in glass thermometers as it is the only metal which is liquid at room temperature. Besides it does not stick to glass and it has high coefficient of expansion due to which a slight change in temperature can be easily recorded.

8. Solubility of a solute (other than gas) increases with the increase in temperature. On heating the liquid develops the capacity of dissolving some more solute to it. That is the saturated solution becomes unsaturated due to increase in the solubility.

9. Chemical change can be explained as a change in which a new substance is formed and the process is irreversible. The rust is a brown chemical compound known as hydrated ferric oxide ( $\text{Fe}_2\text{O}_3 \cdot x\text{H}_2\text{O}$ ) which is formed when iron reacts with oxygen and water. Formula of rust shows that iron has undergone a chemical change.

10. **Crystallisation** is a process that separates a pure solid in the form of crystals from its solution. It is used to purify solids. E.g. Salt obtained from sea water is purified using crystallisation.

11. i. A true solution is homogeneous mixture whereas a colloidal solution is a heterogeneous mixture.

ii. A true solution is always clear and transparent whereas a colloidal solution is translucent.

iii. The diameter of the particles of a solute in a true solution is of the order of 1 nm or less. The size of the colloidal particles is between 1 nm and 100 nm.

iv. A solute can be recovered from a true solution by evaporation or crystallisation but the particles of a colloidal solution cannot be recovered by evaporation or crystallisation. However, they can be separated through centrifugation.

v. Particles of a true solution do not scatter a beam of light whereas particles of a colloidal solution scatter a strong beam of light that is passed through the solution.

12. Ammonium chloride exhibits sublimation and changes directly from solid into the gaseous state on heating.

Therefore, a mixture of salt and ammonium chloride can be separated by the process

of sublimation.

The following steps would be involved in the separation:-

- i. The mixture of ammonium chloride ( $\text{NH}_4\text{Cl}$ ) and salt is placed in a china dish. The china dish is placed inside an inverted funnel as shown in the figure.
- ii. The mixture is heated on a low flame. On heating, ammonium chloride sublimes and changes directly into vapours. The vapours of ammonium chloride get condensed on the inner sides of the funnel.
- iii. Salt does not sublime and is left behind in the china dish.
- iv. The fine powder of  $\text{NH}_4\text{Cl}$  can be scrapped from the sides of the funnel.

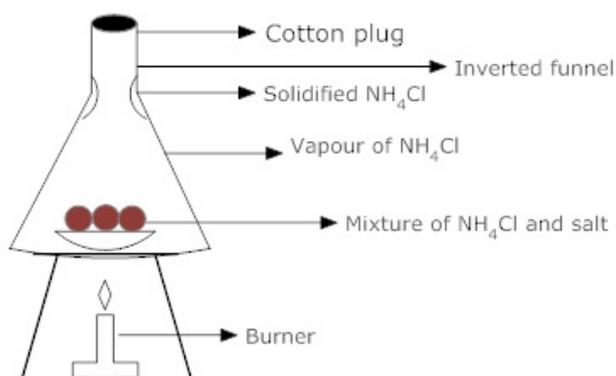

Fig: Separation of  $\text{NH}_4\text{Cl}$  and salt by sublimation

13. Sea water is a mixture of salts and water which cannot be separated except by evaporation. Therefore, sea water is considered as a homogeneous mixture. But other than salts and water, sea water also contains mud, decayed plant, etc. So it is considered as a heterogeneous mixture. Therefore, sea water can be classified as homogeneous as well as heterogeneous mixture
14. A compound is always a single substance in which two or more elements are combined chemically. A mixture is a combination of elements or compounds or both. Thus, a compound fulfils the definition of a pure substance but not a mixture. Moreover, a compound has a sharp melting or boiling point while a mixture does not have.
15. Fog and cloud are the examples in which liquid is the dispersed phase and gas (air) is the dispersion medium. The only difference between them is that clouds are formed in the upper atmosphere while fog gets formed in the region close to earth.

# Chemistry

## Chapter:- Is matter around us Pure

- 1) Define pure substance and mixture <https://youtu.be/pxfKOBxTJDo>
- 2) Different types of Mixture <https://youtu.be/G8bbON6PRBI>
- 3) Learn the different methods of separating the component of a mixture <https://youtu.be/4U1zX7zh8xU>
- 4) Define Concentration of Solution <https://youtu.be/KMM5cxp5bcU>
- 5) Different types of Solution <https://youtu.be/9hYvEIPjKIU>
- 6) Define Brownian movement <https://youtu.be/EodIPOyO0hY>
- 7) learn the difference between saturated, unsaturated and super saturated solution <https://youtu.be/AKk9JndrfaM>
- 8) What are Physical and Chemical changes <https://youtu.be/bIP0J6nywX0>
- 9) What are alloys <https://youtu.be/esfalkw0jz8>
- 10) Try to solve the Blue text question and exercise question from NCERT book <https://youtu.be/5w-9MMkFOWk>

## Assignment

1. State any one difference between pure and impure substances.
2. What is meant by concentration of a solution?
3. List the two conditions essential for using distillation as a method for separation of the components from a mixture.
4. Smoke and fog both are aerosols. In what way are they different?
5. Salt can be recovered from its solution by evaporation. Can you suggest any other technique also?
6. Can we separate alcohol dissolved in water by using a separating funnel? If yes, then describe the procedure. If not, explain.
7. How Tyndall effect can be observed in the canopy of a dense forest.
8. Explain why particles of a colloidal solution do not settle down when left undisturbed, while in the case of a suspension they do.
9. Non-metals are usually poor conductors of heat and electricity. They are non-lustrous, non-sonorous, non-malleable and are coloured.
  - A. Name a lustrous non-metal.
  - B. Name a non-metal which exists as a liquid at room temperature.
  - C. The allotropic form of a non – metal is a good conductor of electricity. Name the allotrope.

D. Name a non-metal which is known to form the largest number of compounds.

E. Name a non-metal other than carbon which shows allotropy.

F. Name a non-metal which is required for combustion

10. You are provided with solution of substance 'X'. how will you test whether it is saturated or unsaturated with respect to 'X' at a given temperature? What happens when a hot saturated solution is allowed to cool?

11. Name the appropriate methods to separate the following:

A. Nitrogen from air

B. Dye from blue ink

C. Butter cream from milk

D. Ammonium chloride from common salt
